

COMMUNITY ACQUIRED PNEUMONIA & SEPTIC SHOCK

FLUID CHOICE AND VOLUME

Massive Fluid Resuscitation

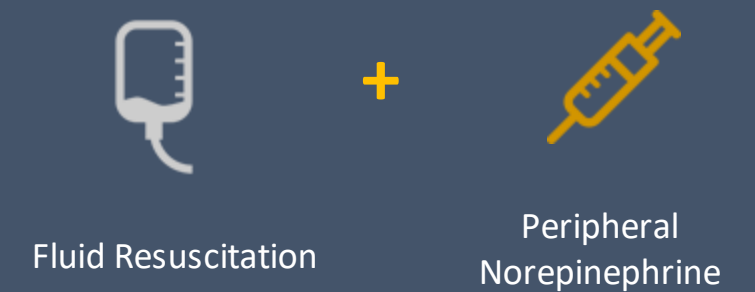

Worsen hypoxemia respiratory failure
Precipitate need for intubation

RESUSCITATION

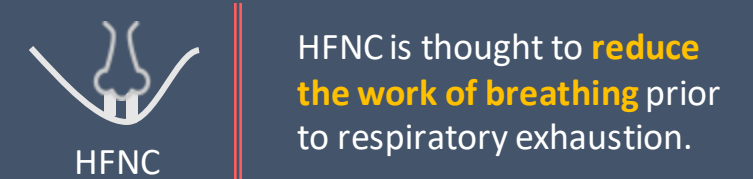

NOREPINEPHRINE

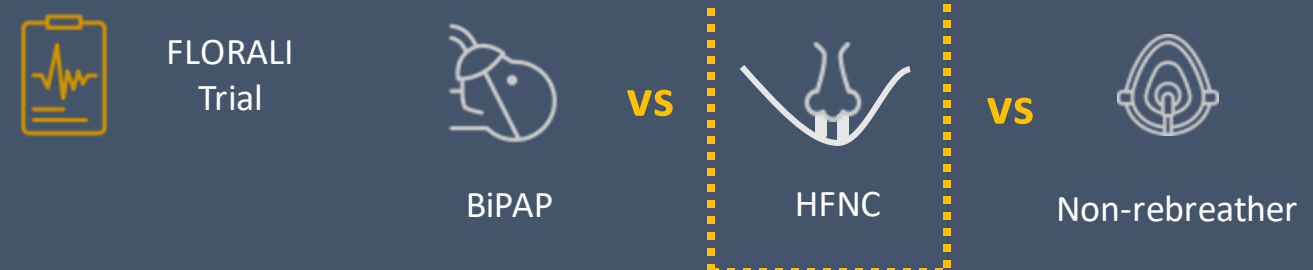

Cardiogenic Pulmonary Edema
And possibly decreased mortality

HIGH FLOW NASAL CANULLA

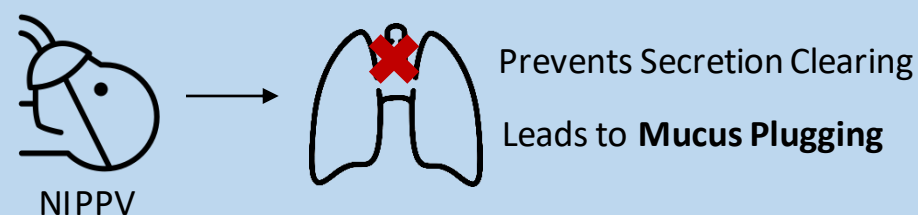

In severely hypoxic patients

NON INVASIVE POSITIVE PRESSURE VENTILATION

Theoretically...

However...

1

Can be used as a bridge to intubation

2

May be helpful in concurrent COPD exacerbation, where the evidence shows benefit
